

### Esprit Electronics choose Ecotile ESD tiles again

#### The Challenge

Esprit Electronics provides a comprehensive range of Electronic Manufacturing Services (EMS) to UK and European markets, with a reputation for developing bespoke and robust solutions. This is underpinned by Esprit's extensive Supply Chain capability and recognised by customers as a key differentiator. Investment is critical if Esprit is to remain at the forefront of electronic manufacture and test. To this end, Esprit continues to invest in capital equipment & automation, training and new technologies in support of its customers.

During March 2016, Esprit Electronics invested in further SMT equipment installing their fourth Ipulse platform, dual M20 machines. Along with this significant outlay it was time to replace the original Ecotile flooring which had lasted well for the past 17 years but in the context of the new equipment had started to look a little tired.

There was only one choice and that was to return to Ecotile for its replacement.

#### The Solution

In addition to the 300 square meters at its Hamble facility a further 350 metres were installed at the Swanwick site. Later in the year a further 120 meters will be laid in the 'Goods In' and Warehouse areas.

"We have always chosen the interlocking system due to its versatility, ease of install and obviously its compliance with EN61340-5. The finish the floor gives us is modern and there are also hidden benefits, with the ability to replace damaged tiles easily as well as protecting product or items which may inadvertently fall on the floor. The cushioning effect has saved the day in a number of cases! "

*Lee Holloway – Technical Director, Esprit.*
